

Authorization Developer Documentation

Overview:

The website is currently using firebase for the entire backend

- Using auth to handle user sign-in and account creation
- When new users are created, they are added to the users database

User management functions are found in hrdc/api/user-management.js

- Included account manipulation
- Getters and setters for user info (role, username, password)

To access the firebase let dylan know and he'll add your email

Implementation:

Every page checks user credentials before loading

If a user has specific credentials such as "admin," specific content will load

This is implemented with if statements

Pseudocode:

```
if (user.role == admin){  
    Show hidden content  
} else {  
    Show default content
```

This is the core of home.js
